                                                                                                                                                                                                                                                                                                                                         The present interaction describes a mercino (Mar.) for users in present in present in the mismatch, where (I) have melting temperatures within a narrow range. The method is useful for detecting infectious diseases caused by bacterial infectious agents e.g. Salmonella, Listeria monocytogenes and Haemophilus influenza, fungal infectious agents e.g. Cryptococcus neoformans, Candida albicans and Aspergillus funigautus, viruses e.g. T-cell lymphocytotrophis cirus, Epstein-Barr virus and pollo virus, and parasitic infectious agents e.g. Estected from Onchoverya volvulus, Entemocha historytica and Dracunculus medinesis. The method is also useful for detecting genetic diseases such as 21 hydroxylase deficiency, Turner Syndrome and obseity defects.

CC selected from Onchoverya volvulus, Entemocha historytica and Dracunculus involved in DNA amplification, replication, recombination or repair, the cancer is specifically associated with a gene selected from BRCAI gene, CC process oused for environmental monitoring, forensics and the food and feed industry, detecting comprises scanning (using e.g. a scanning electron microscope and infrared microscope) the support at the correlating (using using eugenese and infrared microscope) the support at the presence or absence of the target uncleotide sequences. ABBB2074 to a presence or absence of the target uncleotide sequences. ABBB2074 to a britance in the exemplification of the control or a presence or absence or the target model or the exemplification of the control or a presence or absence or ab
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; interferon gamma receptor 1; IFNGR1; autoimmune disorder; cancer; diabetes; autoimmune thyroiditis; multiple sclerosis; immunosuppressive; infection; neuroprotective; inflammation; cytostatic; antisense therapy; autoimmune arthritis; autoimmune insulinitis; Crohn's disease; tumour; receptor; antisense; phosphorothioate backbone; ss.
                                                                                                                                                                         Designing capture oligonucleotide probes for use on a support to which complementary oligonucleotides hybridize with little mismatch -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                      The present invention describes a method (M1) for designing capture
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /note= "Phosphorothioate backbone, All cytidine residues are 5-methylcytidines"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ;

The invention relates to an antisense compound 20-50 nucleobases in length targeted to a start codon region, coding region, a stop codon region of a nucleic acid molecule encoding human Interleukin 12 p40 subunit. The compound specifically hybridises with one of the region and inhibits the expression of human Interleukin 12 p40 subunit. The new compound is useful for inhibiting the expression of human Interleukin 12 p40 subunit in cells or tissues and comprises contacting the cells or tissues in vitro with the compound, so that expression of the human Interleukin 12 p40 subunit is inhibited. The antisense compound any also be used as research reagents and diagnostics, and as treatment or prevention of disease states, e.g. to prevent or delay infection, inflammation or tumour formation, in an antisense oligonucleotide
                                                                                                                         nucleotides are linked via a phosphorothioate backbone"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to antisense compounds, composition and methods for modulating the expression of human interferon gamma receptor 2 (IFNRR2). The compositions comprise antisense compounds targetted to nucleic acids encoding IFNGR2. Antisense compounds of the invention are useful for treating diseases or conditions associated with IFNGR2, e.g. autoimmune thyroiditis, diabetes, multiple sclerosis, autoimmune thyroiditis, diabetes, multiple sclerosis, autoimmune arthitis, autoimmune insulinitis or Crohn's disease), cancer, or a disease/disorder caused by aberrant apoptosis. They are also useful for diagnostics, therapeutics, prophylaxis or as research reagents or kits. The invention is useful in gene therapy. The present sequence is an antisense oligonucleotide targetted to human IFNGR2 DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human interleukin 12 p40 subunit antisense oligonucleotide ISIS #139157.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New antisense oligonucleotides for modulating Interferon gamma receptor 2, particularly useful for treating autoimmune disorders (e.g. multiple sclerosis or Crohn's disease), cancers or diseases caused by aberrant

The invention discloses antisense oligomucleotides that specifically hybridise with a region encoding human serum amyloid A4 (SAA4) and inhibit its expression. Lipoproteins are globular, micelle-like particles which have been classified into five categories. The protein components of lipoproteins are known as apolipoproteins, and one family of these are the serum amyloid proteins. These apolipoproteins are associated with the tigh density lipoprotein (Hibl) and act as precursors of the amyloid A proteins found in amyloid fibril deposits formed during the process of amyloidosis. The amyloid and methods are useful for amyloidosis. The ompounds are also useful for indianosists. The compounds are also useful for diagnosing, preventing and treating (using antisense therapy) diseases associated with elevated expression of serum amyloid A4, e.g. tumour formation or inflammatory and continuation as the manual archites and familial Mediterranean fever.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The antisense compounds can also be used as research reagents and diagnostics, or as tools in differential and/or combinatorial analyses to elucidate expression patterns of a portion or the entire complement of genes expressed within cells or tissues. The sequences presented in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAQ20005
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ద
```

```
The 3' end of this oligonucleotide carries 1,3-propanediol. The oligo is one of four oligonucleotides which were designed to specifically bind and cross-link to the duplex target sequence AAQ20004. Oligo #1 has the covalent cross-linking group, i.e. N4N4-ethanocytosine, at its 5' end. An assay for crosslinked triple helix showed considerable reaction with Oligo #1 and with Oligo #2 The most complete reaction with Oligo #3 (see AAQ20006) which has the crosslinking group at the 3' end. The most complete reaction with Oligo #3 (see AAQ20007) having N4N4-ethanocytosine at both the 5' and 3' termini, A control oligo with no cross-linking group showed no reaction. The half-life of the cross-linking reaction for Oligo #2 was ca. 1 hr (1 microM); Oligo #1 showed a rate four times slower. See also AAQ20008.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
             Oligonucleotide #1 able to covalently cross-link to target DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                .<u>.</u>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New sequence-specific non-photo-activated crosslinking agents -
bind to the major groove of duplex DNA and are esp. useful for
treating latent infections e.g. HIV

```
The invention describes an enzymatic nucleic acid molecule (I) which down regulates expression of a sequence encoding a subunit of nuclear factor regulates expression of a sequence encoding a subunit of nuclear regulates expression of a sequence encoding a subunit of nuclear can emberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A. (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially MG^2+. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung, croycate, colorectal, brain, oesophageal, stomach, bladder, pancreatic, crovical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or wultidrug resistant cancer. The method involves use of other drug therapies such as monoclonal antibodies REL-A-specific inhibitors or chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate, compensation therapy. The enzymatic and antisense nucleic configuous are also useful for treating inflammatory disease such as monoclousl as treating inflammatory disease such as chematoid arthritis, restenosis, asthma, Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft
                                                                                                                                                                                                                                          Grayer, mucratic actus, interest actus, excepts or, except actually matter actus, interest actus, except actus, except actus, except actus, except bung cancer; brostate cancer; colorectal cancer; brain cancer; besophageal cancer; scheach cancer; bland cancer; parametric cancer; cervical cancer; had and neck cancer; ovarian cancer; melanoma; lymphoma; glioma; multidrug resistant cancer; REL-A-specific inhibitor; chemotherapy; paclitaxel; docetaxel; cisplatin; methotrexate; gencitabine; radiation therapy; inflammatory disease; asthma; diabetes; prematoin arthritis; restences; Crohn's disease; asthma; diabetes; rheumatoid arthritis; restences; Crohn's disease; asthma; diabetes; chemotherapy; autoimmune disease; lupus; multiple sclerosis; scpase; transplant/graft rejection; reperfusion injury; glomerulonephritis; allergic airway inflammation; inflammatory bowel disease; infection;
                                                                                                                                                                                                                                 Enzymatic nucleic acid; nuclear factor kappa B; NFKB; inozyme; zinzyme;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel enzymatic nucleic acid molecules which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases
                                                                                                                                                                                 sub-unit modulating inozyme substrate #138.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Draper KG;

Gaps
rejection, gene therapy applications, ischaemia/reperfusion injury (central nervous system (CNS) and myocardial), glomerulonephritis, sepsis, allergic airway inflammation, inflammatory bowel disease or inflection. This sequence represents the substrate of a novel enzymatic nucleic acid molecule.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The 3' end of this oligonucleotide carries 1,3-propanediol. The oligo is one of four oligonucleotides which were designed to specifically bind and cross-link to the duplex target sequence AAQ20004. Oligo #3 has a covalent cross-linking group, i.e.
                                                                                                                         .

crosslinked triple helix showed the most complete reaction with Oligo #3. A control oligo with no cross-linking group showed no reaction while Oligos #1 (see AAQ20005) and #2 (AAQ20006) with the crosslinking group at the 5' and 3' ends, respectively, showed considerable reaction. An oligomuclectide with N4M4-ethanocytosine within its sequence (see AAQ20008) showed less effective binding.
at its 5'- and 3'-ends. An assay for
N4N4-ethanocytosine,

Use of HMG-1, high mobility group, genes - for developing products for treating obesity and tumours by reducing the activity of HMGI genes and for developing diagnostic and drug screening assays.

Example; Page 48; 97pp; English.

A method has been developed for treating obesity in a mammal. The method comprises reducing the biological activity of HMGI (high mobility group-1) genes in the mammal. Reducing the activity of HMGI genes can be used for treating obesity. The method can also be used for the diagnosis and treatment of tumours such as tterine leiomyomata, lipomas, pleomorphic adenomas of the salivary gland, pulmonary chondroid hamartoma, endometrial polyps, epithelial breast tumours, hemanglopericytoma or angiomycoma . The tumours may also be a malignant tumour of epithelial origin and may be a carcinoma of the lung, colon, breast, prostate, thyroid gland, or skin. The HMGI genes and proteins may also be used as a starting point to isolate downstream target genes regulated by the MGGI genes and proteins. The present sequence represents a PCR primer for HMGI-C used in an example from the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinases other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1. Representative examples of tibozyme recognition sites are given in AAA82115 to AAA86787. The ribozyme of the invention is useful for inhibiting restences by introduction of the ribozyme is resistant to endonuclease activity and hence is efficient in restenosis treatment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves RNA encoding a cyclin or cell-cycle dependent kinase other than CDK1, PCNA and Cyclin B1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

```
The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1.
Representative examples of ribozyme recognition sites are given in AAA82115 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme is resistant to endomuclease activity and hence is efficient in restenosis treatment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves RNA encoding a cyclin or cell-cycle dependent kinase other than CDKI, PCNA and Cyclin B1 -

The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme (I) which cleaves RNA encoding a cytokine involved in inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid segment encoding (I). (I) can have antipsoriatic, dermatological, cytostatic, antiseborrheic, antidiabetic, antisickling, ophthalmological, vulnerary, keratolytic and virucide activities, and cleaves RNA encoding cytokine involved in inflammation. (I) can be used in gene therapy. (I) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, squamous or basal cell carcinoma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detechment, and for treating and preventing scarring such as keloid, adhesion and hypertrophic or hypertrophic burn scar. AMHS7577 to AAH62099 represent sequences used in the

Treating proliferative skin or eye diseases and scarring, using ribozymes that cleave RNA encoding cytokines involved in inflammation, matrix metalloproteinases, growth factors and cell-cycle dependent

```

The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme [1] which cleaves RNA encoding a cytckine involved in inflammation, matrix metalloproteinse (MMP), cyclin, coll-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid segment encoding (I). (I) can have antipsoriatic, antisickling, dermatological, cytostatic, antiseborrheic, antidiabetic, antisickling, ophthalmological, vulnerary, keratolytic and virucide activities, and cleaves RNA encoding cytokine involved in inflammation. (I) can be used in gene therapy. (I) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, squamous or basal cell carcinoma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing promiting and preventing and p scarring such as keloid, adhesion and hypertrophic or hypertrophic burn Treating proliferative skin or eye diseases and scarring, using ribozymes that cleave RNA encoding cytokines involved in inflammation, matrix metalloproteinases, growth factors and cell-cycle dependent scar. AAH57577 to AAH62099 represent seguences used in the exemplification of the present invention. Example 1; Page 102; 408pp; English. 26-OCT-2000; 2000WO-US29500. Detection of high mobility group DNA binding proteins HMGI-C or HMG(Y), useful as diagnostic markers for benign mesenchymal or lipoma tumours

Examples; Column 23; 32pp; English.

The invention relates to a method for detecting high mobility group DNA binding proteins HMGIC or HMGI(Y) as a diagnostic marker for benign or maining a proces specific HMGI-C or HMGI(Y) to detect their presence. HMGI-C and HMGI(Y) are homologous but distinct members of their presence. HMGI-C and HMGI(Y) are homologous but distinct members of their presence. HMGI-C and HMGI(Y) are homologous but distinct members of their presence. HMGI-C and HMGI(Y) are bomologous but distinct members of commally expressed in the mouse, lack of HMGI-C function results in the progression and adipogences.

The mail and according to the mice are 60% smaller than wild-type animals, are highly reduced fat content. In humans, expression of HMGI proteins lie highly correlated with the progression and metastasis of mailsmant undours of the mammary, thyroid and proteins elsewith the HMGI genes and expression of the resultant chimeric proteins also leads to the development of solid unmours. The human iMGI-C gene, located on chromosome 12q1s, has been found to be disrupted by translocations in a wide variety of benign mesenchymal neoplasms such as lipomas, uterine leiomyomata (fibroids), pulmonary copiedial breast tumours, hemmangiopericytoma and aggreesive myxoma. The HMGI-C gene allowed mounts are also involved in endometrial polyps.

Copiedial breast tumours, hemmangiopericytoma and aggreesive myxoma. These HMGI-C gene arrangements result in novel chimeric transcripts which encode fusion proteins comprising the HMGI-C gene arrangements result in novel chimeric transcripts which encode fusion proteins comprising the HMGI-C gene and a region of chromosome 15 (tliss) results in the generation of a heterologous protein derived from a lifteness comprising the HMGI-C gene and a region of chromosome 15 (tliss) results in the present of a protein organism struct to decapilate the critication domains which procession. These house mounts and a resolution protein organism struct to decapilate the critication protein organism struct to decapilate

Fusarium oxysporum gene promoter fragment and "carenzyme" (RTM) primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A forward primer (AAT10190) is based on the Fusarium oxysporum trypsin-like protease SP357 gene promoter (AAT10184) and the 5' end of the Humicola insolens endoglucanase Carezyme gene. It was used with a reverse primer (AAT10191) based on the 3' end of the Carezyme coding region to generate a PCR fragment contg. -18 to -1 of the SP387 promoter directly followed by -1 to +294 of the Carezyme gene, using vector pCaHj418 as template. The PCR product was used to construct vector pDM15!, utilised for prodn. of Carezyme in Fusarium graminearum ATCC 20334 host cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Obtaining mutant filamentous fungal cells with improved polypeptide production - by examination for restricted colonial phenotype and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Fusarium oxysporum; trypsin gene promoter; filamentous fungal cell;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The sequences given in AAQ86242-45 are primers which were used to demonstrate the method of the invention. This method comprises making a known standard RNA containing an mRNA from a related organism in formation with DNA fragments from a target DNA to form hybrid DNA fragments. FCR is carried out using two primers, one based on the standard DNA and one based on the target DNA. The standard DNA contains a restriction site which does not appear in the target DNA the amount of target DNA is determined by comparing the amount of cut and uncut DNA after treatment with the enzyme
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Determination of mRNA by reverse transcriptase-PCR method - allows quantitative measurement of very small amounts of mRNA's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 .
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Alkaline endoglucanase; Carezyme; cellulase; host cell;

purposed and proposed to the fundant colling and the fundation of the fundation of the fundation of purposed from trypsin gene promoter directly followed by -1 to +294 of the "carenzyme" (RTM) callulase gene was generated from the vector pCaHjals using the PCR primers (AAT64841-2). Fusarium wild type and mutant callulase was monitored. The primers were used to demonstrate a novel method of botaining a mutant cell from a filamentous fungal parent cell where production of a heterologous polypeptide is improved in the mutant. The method comprises: obtaining mutant cells, identifying a mutant cell method of production of a heterologous polypeptide is improved in the mutant. The method comprises: obtaining mutant cells, identifying a mutant cell where hyphal branching than parent cells, and determining that the mutant cell carbinates a heterologous polypeptide and parent cells transformed to express a heterologous polypeptide and parent cells transformed to express prokaryotic or eukaryotic peptides or polypeptides, e.g. fungal enzymes conditions. Mutants obtained by the method can be used to express prokaryotic or eukaryotic peptides or polypeptides, e.g. fungal enzymes carboxypeptidases or mammalian peptides such as insulin, insulin variants, receptors proteins and antibodies. The mutants may possess in parts of improved growth characteristics in fermentation. Mutants may also have better events and the parts of th
                                                                                                                                                                            primers AAT64841-2 were used to construct Fusarium expression vector
more extensive hyphal branching than parent fungal cells

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Fusarium
                           AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ7440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: They can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and disgnostic methods, as well as the characterisation of the differential efficacious responses to and side
                                                                                                                                                                                                                           effects from pharmaceutical agents acting on a disease as well as other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a non-toxic, non-pathogenic recombinant Fusa host cell of the section Discolor, with ATCC accession number 20334. cell is used in the recombinant production of proteins. The present sequence represents a PCR primer used to construct a trypsin-like protease gene SP387 promoter and endoglucanase fusion nucleotide sequence. The fragment is used in the production of the cells of the
                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Non-toxic; non-pathogenic; recombinant protein production; protease; trypsin-like protease; PCR primer; fungal enzyme; ss.
                                                                                                                                                                                                                                               N.B. The SEQ ID NOS 2852, 2913, 2974, 3035, 3096, 3157, 3227, 3297 and 3367, are not actually given a sequence in the Sequence Listing from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New non-pathogenic recombinant fusarium host cell, useful for expressing heterologous proteins especially fungal enzymes such as alkaline endoglucanase or alkaline protease -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Reverse PCR primer used endoglucanase fusion protein construction.
                                                                                                                                                                                                                                                                                                                                                                                                     0,

invention. The cells are useful for expressing heterologous proteins especially fungal enzymes such as alkaline endoglucanase or alkaline proteases, e.g. F. oxysporum pre-pro trypsin gene, and also hormones, growth factors and receptors. The cells are non-toxic and are efficient in the recombinant production of fungal enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                          Human NOVINTRA C DNA specific forward primer of primer-probe set Ag903.

The invention also provides methods in which a NOVX polypeptide, polynucleotide and antibody are used in the detection, prevention and treatment of a broad range of pathological states. NOVTRAN can be used to treat is a cell signaling disorder such as cancer, immune response disorder, hematopoietic disorder, neurodegenerative disorder. NOVNEUR can be used to treat endocrine disorder, muscle disorder, neurologic disorder, cancers endocrine disorder, unscle disorder, neurologic disorder, cancers of central nervous system, breast, colon, ovary, kidney, prostate and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ABB49406). Definition in the similarity to all known prion proteins (Prp) and study of prion-related genes may give insight into the general biology and progression of neurodegenerative disorders, and the mechanistic alterations that result in prion-mediated disorders and plaque formation. Detection of Dpl levels and/or presence of different conformations of Dpl can provide a means for diagnosing neurodegenerative disorders associated with Dpl particularly those involving Purkinje cell degeneration, such as hereditary cerebellar cortical atrophy. The present
                                                                       set
            metabolic function disorder and melanoma. NOVINTRA A and B can be used to treat bone metabolism or structure disorder, inflammatory response disorder, immune regulation disorder. Septics shock, stroke, diabetes, arthitis and cancer. Sequences AAF83877-79 represent a primer-probe se A9903 specific for the NOVINTRA C nucleic acid sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ^{\mathsf{che}}
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to doppel (Dpl) proteins (see AAB49404-
                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    use of the nucleic acids/peptides for understanding the mechanisms involved in the progression of neurodegenerative diseases involving

Novel human potassium channel beta-subunit, K+betaM3 polypeptide and polynucleotide for diagnosing, preventing and treating immune, metabolic, gastrointestinal, renal, neural and proliferative diseases or disorders -

3xample 7; Page 245; 367pp; English.

The present invention describes the human potassium channel beta-subunit

K+betaM3 protein (I). (I) has cytostatic, antiaddictive, antiarthritic,
antiasthmatic, anti-HIV, antirheumatic, antiadcterial, immunosuppressive,
antispsoriatic, dermatological, antianaemic, nootropic, neuroprotective,
anticonvulsant, neuroleptic, antimanic, antidepressant, antiulcer,
anticonvulsant, neuroleptic, antimanic, nephrotropic, hypotensive,
antianginal, uropathic, tocolytic, antiallergic and vulnerary activities,
and can be used in gene therapy. (I) can be used for diagnosing a
condition (or susceptibility) in a subject, and for
preventing and treating a medical condition, e.g. neural disorders
related to aberrant neurotransmitter release or drug addiction, a
related to aberrant nuclear factor-Kappa (NF-KB) activity, immune
conserved aberrant nuclear factor-Kappa (NF-KB) activity, immune
disorder related to transplant rejection, immune disorder in which
concer, or a proliferative disorder related to an aberrant cell cycle
cancer, or a proliferative disorder related to an aberration(8) in the
cregulation, a proliferative disorder related to an aberration(8) in the
cregulation, a proliferative disorder related to an aberration(8) in the
credulation, a proliferative disorder related to an aberration(8) in the
credulation, a proliferative disorder related to an aberration(8) in the
credulation, a proliferative disorder related to an aberration(8) in the
credulation, haematopoietic, metabolic, gastrointestinal, renal, neural and/or
convert. Danael converted to metabolic, gastrointestinal, renal, neural and

New potassium channel beta-subunit, K-betaM2, proteins and nucleic acids, useful for diagnosing, treating and/or preventing e.g. reproductive, neural, metabolic, endocrine, memory, neurodegenerative disorders or diseases

Example 56; Page 365; 366pp; English.

(K+betaM2) proteins and polynucleotides encoding such proteins. The thetaM2 sequences are useful for diagnosing, treating and/or preventing reproductive disorders, neural disorders, disorders related to aberrant potassium regulation or hyper potassium channel activity, metabolic disorders (e.g. premature puberty), endocrine disorders (e.g. aberrant growth hormone synthesis and/or secretion), memory disorder, disorders of the testis (e.g. spermatogenesis), neuroendocrine condition related to aberrant thyroid hormone release, renal disease or disorders (e.g. nephritis), disorders related to aberrant higher brain function (e.g. learning deficiencies), neurodegenerative diseases (e.g. Alzheimer's disease), proliferative disorders (e.g. carcinoid tumour) and disorders involving excessive smooth muscle tone or excitability (e.g. asthma). present invention relates to human potassium channel beta-subunit

```
They may be used to modulate haemostatic or thrombolytic activity, to treat or prevent blood coagulation diseases or disorders, blood platelet diseases, wounds, autoimmune diseases, disorders or conditions (e.g. rheumatoid arthritis), allergic reactions (e.g. asthma), organ rejection or graft-versus-host disease, and hyperproliferative diseases. K-betam2 sequences are also used in gene therapy. The present DNA sequence is a PCR primer which is used for amplifying Drosophila melanogaster attacinD antimicrobial peptide (AMP) gene. This sequence is used in the exemplification of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0
capacities or low free-radical buffering capacity, delayed sleep phase syndrome, aberrations in circadian cycle, mammary cancer tumourigenesis, age related disorders associated with decreased melatonian secretion, or cancer. This polymuclectide sequence represents a PCR primer relating to the potassium channel beta subunit (K+betaM6) of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                derived from a Penicillium citrinum profein. This protein is is capable of producing (9.4-bromo-3-hydroxybutanoate by asymmetrically reducing 4-bromo-3-coobutanoate. The protein and polynucleotides are useful for producing optically active (8)-4-bromo-3-hydroxybutanoate, which is useful as an intermediate in the production of pharmaceuticals and agrochemicals. The (8)-4-bromo-3-hydroxybutanoate produced can also be used to produce 4-cyano-3-hydroxybutanoate produced can also be used to produce 4-cyano-3-hydroxybutanoic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                          (S)-4-bromo-3-hydroxybutanoate; 4-bromo-3-oxobutanoate; pharmaceutical; agrochemical; 4-cyano-3-hydroxybutanoic acid; PCR; primer; ss.

New NOVX proteins for diagnosing or treating cell signaling, immune response, hematopoietic, neurodegenerative, muscle, endocrine, bone, and reproductive development disorders

Example 1; Page 37; 110pp; English.

cerebroprotective, antidiabacit, antiarthribit, antiasthmatic and antiallergic activities, and can be used in gene therapy and antibody. Contaillergic activities, and can be used in gene therapy and antibody antiallergic activities, and can be used in gene therapy and antibody. Compared to the problem of a methody (III) that binds the polypeptide, are useful for treating or preventing a NOVX protein-associated disorder in humans. NOVTRAN can be used in the treatment of a cell signalling disorder, such as, a haematopoletic disorder or a neurodegenerative disorder. NOVNEUR can be used in the treatment of an endocrine, muscle, neurological disorder, central nervous system cancer, breast, colon, ovarian, kidney, prostate or thyroid cancer. NOVGON can be used in the treatment of a reproductive development disorder, metabolic function disorder or melanoma. NOVINTRA corteins can be used in the treatment of and a bone metabolism or structure disorder, an inflammatory response disorder, an immune regulation disorder, septic shock, stroke, diabetes, arthritis or The present invention describes an isolated NOVX polypeptide, chosen from human transmembrane (NOVTRAN), neuromedin (NOVMBUR), gonadotropin (NOVGON), interleukin-1 (IL-1) receptor antagonist (NOVINTRA A and B), and IL-1 epsilon proteins. NOVX polypeptides have noctropic, cytostatic, neuroprotective, antinflammatory, antibacterial, immunosuppressive,

cancer. An agent which modulates the expression or activity of a human L1 epsilon protein is useful for treating a lung disease such as lung cancer, asthma, emphysema, allergic lung irritation and lung inflammation in a mammal. ABQ73996 to ABQ74027 and ABP51981 to ABP52048 represent sequences used in the exemplification of the present invention. 88888888

Novel ubiquitin conjugating enzyme polypeptide isolated from activated human T cell, for screening modulators useful for treating cancer, immune disorder, lymphoproliferative disorder, neurodegenerative disorder

Example 14; Page 121; 169pp; English.

The invention relates to a novel ubiquitin conjugating enzyme (UBC) homologue, RATL1d6 (regulated in activated T-lymphocytes 1d6) and its corresponding nucleic acid. The invention also relates to methods for treating, diagnosing, preventing and screening for disorders related to the expression of RATL1d6. UBC is useful for screening for candidate compounds capable of binding to and/or modulating its activity. UBC is useful for treating an immune or neuronal disorder in a mammal. The method is useful for treating an immune cancer or tumour. It is useful for suppressing the immune response in a subject requiring the suppression. It is also useful for treating lymphoproliferative disorder, cancer e.g.

adenocarcinoma, leukaemia, myeloma, sarcoma, etc, neurodegenerative disorder. Inflammatory disorders e.g. rheumatorid arthritis, asthma, multiple sclerosis, psoriasis, etc, neuronal disorders e.g. Alzheimer's disease, dementia, depression, epilepsy, etc, immune disorder or immune related disorders such as acquired immuno deficiency syndrome (AIDS), allergy, anaemia, atopic dermatitis, diabetes mellitus, myocardial infarction, etc, developmental disorders e.g. Cushing's syndrome, renal trubular acidosis, gonadal dysgenesis, dysplasia, cataract, etc. The present sequence is a POR primer used for amplifying S2 gene. This sequence is used in the exemplification of the invention. \$\$\$\$\$\$\$\$\$\$\$\$\$**X**8

Designing capture oligonucleotide probes for use on a support to which complementary oligonucleotides hybridize with little mismatch -

Example 5; Fig 29; 300pp; English.

The present invention describes a method (M1) for designing capture oligonucleotide probes (I) for use on a support to which complementary oligonucleotide probes (II) will hybridise with little mismatch, where (I) have melting temperatures within a narrow range. The method is useful for detecting infectious diseases caused by bacterial infectious agents c.g. Salmonella, Listeria monocytogenes and Haemophilus influenza, fungal infectious agents e.g. Cryptococcus neoformans, Candida albicans and Aspergillus fumigautus, viruses e.g. T-cell lymphocytotrophis cirus, Epstein-Barr virus and pollo virus, and parasitic infectious agents medinesis. The method is also useful for detecting genetic diseases such as 21 hydroxylase deficiency, Turner Syndrome and obesity defects.

Detection of nucleic acids in cells - by in situ amplification of target sequences by thermophilic strand displacement amplification

This primer is an example of a "bumper" primer, for the gag gene of HIV It is used in a modified version of thermophilic strand displacement amplification (tSDA) to amplify double stranded DNA in situ.

Amplification primers (see AAT88932-3) are hybridised to both strands of the gene, and are extended. Both primers have a restriction endonuclease (RE) recognition site, and the products will also contain these sites.

The products are displaced from the target sequence, by extension of the bumper primers, which anneal upstream of the amplification primers, and made double stranded causes "nicks" to be created (via the RE recognition sites). Furthur extension occurs from the nicks, thereby displacing a copy of the target sequence from the double stranded amplification primer extension products. The nicking, extending and displacing steps are repeated, and the target sequence amplified in

```
ö
situ. The method can be used for the amplification of DNA in situ in cells in suspension, on slides or in tissues, with speed, sensitivity and specificity. In situ tSDA also remains compatible with immunochemical techniques in spite of the increased reaction temparature so both amplification of DNA and immunological staining (see AAT88934 for an example of a detector probe) can be performed on the same specimen.

Homo sapiens WO9833893-A2

The present invention describes enzymatic nucleic acid molecules (NAMS) which specifically cleave RNA derived from an epidermal growth factor receptor (EGF-R) gene. AAV9721 to AAV98043 and AAV9899 to AAV99090 represent specifically claimed target sequence from human EGF-R. AAV98044 to AAV98866 and AAV98867 to V9878 represent hammerhead ribozymes and hairpin ribozymes respectively for human EGF-R. The NAMS are useful for cleaving EGF-R RNA in the treatment of a condition associated with EGFR expression levels e.g. to inhibit cell proliferation in the prevention or treatment of cancers. The NAMS can also be used as diagnostic tools to examine genetic drift and mutations within diseased cells or to detect the presence of EGF-R RNA in a cell.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes enzymatic nucleic acid molecules (NAMs) which specifically cleave RNA derived from an epidermal growth factor receptor (EGF-R) gene. AAV9721 to AAV98643 and AAV98999 to AAV99009 represent specifically claimed target sequence from human EGF-R. AAV99004 haipfuin ribozymes respectively for human EGF-R. The NAMs are useful for cleaving EGF-R RNA in the treatment of a condition associated with EGFR expression levels e.g. to inhibit cell proliferation in the prevention or treatment of cancers. The NAMs can also be used as diagnostic tools to the presence of EGF-R RNA in a cell.
                                                                                                                                                                                           Human; epidermal growth factor receptor; EGFR; EGF-R; target sequence;

The present invention describes a kit for conducting a fluorescence detection assay to determine the presence, absence or amount of a target analyte in a sample. The method and kit may be used to detect amplification of nucleic acid molecules in real time using fluorescence quenching for example. The assays may be used to detect the presence of nucleic acids from pathogens in samples of body fluid from patients. The kit allows a homogeneous nucleic acid amplification and real time nucleic acid probe detection assay to be carried out with minimal complexity which yields a consistent reliable fluorescent detection signal. The present sequence represents a primer used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Ribozyme; erythropoietin; granulocyte colony stimulating factor; interferon alpha; ss.

Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoietin, granulocyte colony stimulating factor protein and interferon alpha.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EAR3/COUP-TP-1, the GATA transcription factor gene, IRF-2 and/or the CAATT Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoietin, granulocyte colony stimulating factor protein and interferon alpha.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   0
                                                                                                                                                                                                                                                              The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EAR3/COUD-TF-1, the GATA transcription factor gene, IRF-2 and/or the CAMT bisplacement brotein (CDP). Inhibition of the repressors removes prevents inhibition and consequently increases expression of) genes involved in the production of erythropoletin, granulocyte colony stimulating factor protein and interferon alpha.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EAR3/COUP-TF-1, the GATA transcription factor gene, IRF-2 and/or the CAATT Displacement
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                 Enzymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin -

```
The present invention provides single-stranded oligonucleotides which can be used for the targeted alteration of genomic sequences, where the oligonucleotide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin, ethioblastoma, BRCAL, BRCAZ, CFTR, cyclin-dependent kinase inhibitor 2A (CDKNZA), APC, Factor V, Factor VIII, Factor IX, haemoglobin alpha locus 2 (HBA1), haemoglobin alpha locus 2 (HBA2), MIH1, MSH2, MSH6, apolioprotein E (APOS), LDL receptor (LDIR), UDP-diruconosyltransferase (UGT1), amyloid precursor protein (APC), presentlin-1 (PSEN1) and present acancer, adenosine deaminase deficiency, cystic fibrosis, happrocholesterolaemia, thalassaemia, sickle cell anaemia, Alzheimer's disease, melanoma, adenomatous polyposis of the colon and various syndromes: The present sequence is one of the gene correcting
mismatch repair; MSH2; MSH6; hyperlipidaemia; apolipoprotein E; LDLR; familial hypercholesterolaemia; UGT1; syndrome; APP; PSEN1; antisense; UDP-glucuronosyltransferase; amyloid precursor protein; presentlin-1; Alzheimer's disease; cytostatic; antisickling; antianaemic; haemostatic; antilipemic; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; gene therapy; adenosine deaminase deficiency; p53; beta-globin; retinolastoma; BRCA1; RTR; cystic fibrosis; cancer; Factor V; cyclin-dependent kinase inhibitor 2A; CDKN2A; melanoma; APC; HBA1; HBA2; adenomatous polyposis of the colon; Factor VII; Factor IX; thrombosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Oligonuclectide for targeted alterations of genetic sequences and for treating cystic fibrosis, comprises at least one mismatch and chemical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        mutation correcting oligonucleotide SEQ ID NO: 1875.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Score 13.8; DB 1; Length 1

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            displaying polypeptides in a phage display system. The method comprises insertion of a polypeptide sequence in the p3 coat protein, followed by proteolysis. The method requence in the p3 coat protein, display techniques. The method is used to select for viruses displaying desired polypeptides. The methods may also be used for the identification of interacting protein elements, and for the selection of a repertoire of polypeptides which interact with a selected polypeptide and/or repertoire. PCR primers AAZ4554-25 were used to screen for the presence of the pelb or g3 leader sequences. The leader sequences were used to generate tlibraries, which are used to generate cleavable phage becomes in which poorly displayed proteins such as DNA polymerases are
                                                                                                                                       Primer used to screen for the presence of the pelB or g3 leader sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; gene therapy; adenosine deaminase deficiency; p53; beta-globin; retinoblastoma; BRCA1; BRCA2; CFTR, cystic fibrosis; cancer; Factor V; cyclin-dependent kinase inhibitor 2A; CDKN24; melanoma, ABC; HBA1; HBA2; adenomatous polyposis of the colon; Factor VII; Factor IX; thrombosis; haemophilia; alpha thalassaemia; haemoglobin alpha locus 1; MLH1; APOE;

The present invention provides single-stranded oligonuclectides which can be used for the targeted alteration of genomic sequences, where the oligonucleotide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin, retinoblastoma, BRCA1, BRCA2, CFTR, cyclin-dependent kinase inhibitor 2A (CDKN2A), APC, Factor VII, Factor IX, haemoglobin alpha locus (HEAA1), haemoglobin alpha locus 2 (HEAA1), amyloid precursor protein (ADC), presentilar-1 (PSENI) and protein E (APOE), LDL receptor (LDLR), UDP-glucuronosyltransferase (UGT11), amyloid precursor protein (APC), presentilar-1 (PSENI) and protein deaminase deficiency, cystic fibrosis, haemophilia, hypercholesterolaemia, thalassaemia, sickle cell anaemia, halzheimer's disease, melanoma, adenomatous polyposis of the colon and various syndromes. The present sequence is one of the gene correcting oligonucleotides of the invention. Sequence 17 BP; 7 A; 4 C; 4 G; 2 T; 0 other;

```
The present invention relates to a method for treating a patient diagnosed as having a lower than normal high density lipoprotein-cholesterol (HDL-C) level, a higher than normal triglyceride level, or a cardiovascular disease, involving administering a compound that modulates LXR- or RXR-mediated transcriptional activity or ABC1 expression or activity.

The LXR gene product may be used in an assay to identify compounds useful for the treatment of a disease or condition selected a lower than normal HDL cholesterol level, a higher than normal activity and a cardiovascular disease.
                                                                                                                                                                                                                                                                                                      Treating a lower than normal high density lipoprotein-cholesterol (HDL-C) level, a higher than normal trigiyceride level, or a cardiovascular disease, by administering a compound that modulates LXR-or RXR-mediated transcriptional activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NOGO).

The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a DNAzyme) an Inozyme (an endolytic nucleic acids (e.g. a ribozyme or a DNAzyme) an Inozyme (cleaving RNA with a NRN molecule opssessing an NRH motif), a G-cleaver (cleaving RNA with a NRN molecule of cleaving RNA with a NGN triplet) a zinzyme (cleaving RNA with an NGN triplet) a zinzyme (cleaving RNA with a NGN transmore, it may be contacted with a cell to reduce CD20 activity of the cell and treat I particular, the CD20 trangetting cuse of one or more therapies. In particular, the CD20 trangetting cucled capid may be used to treat lymphoma, leukaemia, and lucleic acid may be used to treat lymphocytic leukaemia, and lucleic acid is used to cleave RNA (ML), mantle-cell lymphoma (ML), immunodeficiency virus) associated NHL, mantle-cell lymphoma (MC), immunodeficiency virus) associated NHL, mantle-cell lymphoma (MC), immunodeficiency wirus) associated NHL, match the level of NGO trangetting nucleic acid may be used to cleave RNA of the NGO activity of the cell and treat a patient having a condition associated with the level of NGO trangetting nucleic acid may be used to treat the restance of an particular, the NGO trangetting nucleic acid may be used to treat the nervous exetem (NGO) trangetting nucleic acid may be used to treat the nervous system (NGO) trangetting nucleic acid may be used to treat the nervous system (NGO) trangetting nucleic acid may be used to treat the nervous system (NGO) trangetting nucleic acid may be used to treat the nervous system (NGO) tran
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     central nervous system (CNS) injury and cerebrovascular accident (CVA, stroke). Alzahemer's disease, dementia, multiple sclerosis (MS), chemocherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS), Parkinson's disease, ataxia, Huntington's disease, Creutzfeldt-Jakob disease, muscular dystrophy, amio'ro ther neurodegenerative disease states which respond to the modulation of NOGO expression. The present sequence is an inozyme of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and central nervous system injury
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1.0%; Score 13.8; DB 1; Length 17;

Novel human SH3 domain (POSH)-like signalling protein 1 polypeptide, POSHL-1, useful for treating disorders associated with decreased expression or activity of human POSHL1 -

WPI; 2002-684061/74.

Example 2; SEQ ID NO 1260; 60pp + Sequence Listing; English.

```
protein (POSHL 1) polypeptide (1), comprising a sequence of 730 amino acids (S1, ABBB399), a sequence having 65% sequence identity to (S1), acids (S1, ABBB399), a sequence having 65% sequence identity to (S1), acids (S1, ABBB399), a sequence having 65% sequence identity to (S1), acids (S1, ABBB399), a sequence having 65% sequence identity to (S1), acids (S1, ABBB399), a sequence having 65% sequence identitions or a fragment of the sequences comprising at least 8 contiguous amino acids. Human POSHL 1 is a proto-oncogene/oncogene product that functions as an adaptor protein that interacts with Rho family small Greases as well as downstream components of the signal transduction pathway. (I) is useful for identifying a specific binding partner. (I) and nucleic acids (II) canced by altered expression of human POSHL1 including diagnosing and treating cancer, they useful in the development of vaccines and (II) is useful in gene therapy. (II) is useful for constructing microarrays which care useful for measuring and for surveying gene expression and creating transgenic non-human animals capable of producing the proteins. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Note: The present sequence did not form part of the printed specification, but is based on sequence information supplied to Derwent by the European Patent Office.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to an isolated SH3 domain (POSH)-like signalling
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

```
The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSHL 1) polypeptide (I), comprising a sequence of 730 amino acids (SI, ABBB3999), a sequence having 65% sequence identity to (SI), (SI) having 95% deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. Human PoSHL 1 is a proto-encogene/oncogene product that functions as an adaptor protein that interacts with Rho family small GrPases as well as downstream components of the signal transduction pathway. (I) is useful for identifying a specific binding partner. (I) and nucleic acids (II) for identifying a specific binding partner. (I) and nucleic acids (II) caused by altered expression of human PoSHL1 including diagnosing and treating cancer, they useful in the development of vaccines and (II) is useful in gene therapy. (II) is useful for constructing microarrays which are useful for measuring and for surveying gene expression and creating transgenic non-human animals capable of producing the proteins. The present sequence is that of a scanning oligonucleotide useful in examples
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Note: The present sequence did not form part of the printed specification, but is based on sequence information supplied to Derwent
                                                                                                                                                                        Human; POSHL 1; SH3 domain; POSH-like signalling protein 1; oncogene; Rho GTPase; signal transduction; gene expression; cancer; vaccine;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel human SH3 domain (POSH)-like signalling protein 1 polypeptide, POSHL-1, useful for treating disorders associated with decreased expression or activity of human POSHL1 -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Example 2; SEQ ID NO 1261; 60pp + Sequence Listing, English.
                                                                                                                                        Human POSHL1 scanning oligonucleotide SEQ ID NO 1261.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 17 BP; 3 A; 7 C; 3 G; 4 T; 0 other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              by the European Patent Office.

protein 1 (POSHL 1) polypeptide (1), comprising a sequence of 730 amino acids (S1, ABB3999), a sequence having 65% sequence of 730 amino acids (S1, ABB3999), a sequence having 65% sequence identity to (S1), acids (S1, ABB3999), a sequence having 65% sequence identity to (S1), acids (S1, ABB3999), a sequence having 65% sequence identity to (S1), and respectations, as a sequence comprising at least 8 contiguous amino acids. Human POSHL 1 is a proto-oncogene/oncogene product that functions as an adaptive protein that interacts with Rho family small GTPsaces as well as downstream components of the signal transduction pathway. (I) is useful for identifying a specific binding partner. (I) and nucleic acids (II) and encomponents of the signal transduction pathway. (II) is useful for onstructing diagnosing and treating cancer, they useful in the development of vaccines and treating caucher they useful in the development of vaccines and (II) is useful in gene therapy. (II) is useful for constructing microarrays which transgenic non-human animals capable of producing the proteins. The present sequence is that of a scanning oligonucleotide useful in examples
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             of the invention.

Note: The present sequence did not form part of the printed
specification, but is based on sequence information supplied to Derwent
by the Buropean Patent Office.

The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSHL 1) polypeptide (I), comprising a sequence of 730 amino acids (SI, ABB83999), a sequence having 6fs sequence identity to (SI), (SI) having 5fs deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. Human POSHL 1 is a prote-oncogene/oncogene product that functions as an adaptor protein that interacts with Rho family small GTPases as well as downstream components of the signal transduction pathway. (I) is useful cor identifying a specific binding partner. (I) and mucleic acids (II) encoding (I) are useful for diagnosing, monitoring disease and treating caused by altered expression of human POSHL1 including disease and (II) is cuseful in gene therapy. (II) is useful for constructing microarrays which are useful for measuring and for surveying gene expression and oreating caused the numan animals capable of producing the proteins. The constructing microarrays which are useful for measuring and for surveying gene expression and creating cancer.

Human PoSHL 1 is a process compension of the functions as an adaptor protein that interacts with Rho family small GTPases as well as downstream components of the signal transduction pathway. (1) is useful for identifying a specific binding partner. (1) and nucleic acids (II) encoding (I) are useful for diagnosing, monitoring disease and treating caused by altered expression of human PoSHL1 including diagnosing and treating ancer, they useful is useful for constructing microarrays which are useful for measuring and for surveying gene expression and creating are useful for measuring and for surveying gene expression and creating transgenic non-human animals capable of producing the proteins. The

protein 1 (POSHL 1) polypeptide (I), comprising a sequence of 730 amino acids (S1, ABB8399), a sequence having 65% sequence identity to (S1), (S1) having 95% deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. The invention relates to an isolated SH3 domain (POSH)-like signalling

treating cancer, they useful in the development of vaccines and (II) is useful in gene therapy. (II) is useful for constructing microarrays which are useful for measuring and for surveying gene expression and creating transgenic non-human animals capable of producing the proteins. The present sequence is that of a scanning oligonucleotide useful in examples of the invention.

Note: The present sequence did not form part of the printed specification, but is based on sequence information supplied to Derwent by the European Patent Office.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human, KTOMla; KTOMl; kidney tumour overexpressed membrane; cytostatic; gene therapy; cancer; kidney; liver; bone marrow; brain; heart; lung; kidney; colon; skeletal muscle; testis; uterus; placenta; probe; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a novel isolated nucleic acid encoding human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          nucleic acids encoding the protein, useful for treating subjects ha defects in KTOMI which can manifest as cancer of the kidney, or as disorder of e.g., liver or bone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New human kidney tumor overexpressed membrane (KTOM1) protein and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       8
                                                                                                                                                                                                          o;
          present sequence is that of a scanning oligonucleotide useful in examples
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSH1) polypeptide (1), comprising a sequence of 730 amino acids (SI, ABBB399), a sequence having 65* sequence identity to (SI), (SI) having 95* deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. Human POSHL 1 is a proteo-oncogene-product that functions as an adaptor protein that interacts with Rho family small GTPases as well as downstream components of the signal transduction pathway. (I) is useful for identifying a specific binding partner. (I) and nucleic acids (II) encoding (I) are useful for diagnoshing, monitoring disease and treating caused by altered expression of human POSHL including diagnosing and
                          of the invention.

Note: The present sequence did not form part of the printed specification, but is based on sequence information supplied to Derwent by the European Patent Office.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human, POSHL 1; SH3 domain; POSH-like signalling protein 1; oncogene; Rho GTPase; signal transduction; gene expression; cancer; vaccine; gene therapy; transgenic; ss.

KTOMI (kidney turmour overexpressed membrane) protein. The protein of the invention has cytostatic activity. The nucleotide may have a use in gene therapy. The KTOMI nucleic acids may be used to diagnose, treat or monitor a disease caused by altered expression of human KTOMI.

Compositions comprising the nucleic acids, proteins or antibodies may be used to treat subjects having defects in KTOMI which can manifest as ancer of the kidney, as well as a disorder of liver, bone marrow, brain, heart, lung, kidney, colon, skeletal muscle, testis, uterus and placenta function. The sequence represents a probe used in the invention to scan the nt 1-1001 portion of human KTOMIa (ABQ63232).

Enzymatic polynucleotide that down regulates expression of chloride channel calcium activated gene, useful for treating Chronic obstructive pulmonary disease (COPD), chronic bronchitis and asthma

Claim 4; Page 78; 152pp; English.

The invention relates to enzymatic nucleic acid molecules that down regulate expression of chloride channel calcium activated 1 (CLCA1) genes by cleaving RNA derived from the genes. The nucleic acid sequences are useful as pharmaceutical agents for treating conditions such as chronic obstructive pulmonary disease (COPD), chronic bronchitis, asthma, cystic fibrosis, obstructive bowel syndrome and any other diseases or conditions that are related to or will respond to the levels of CLCA1 in a cell or tissue. The sequences are useful for reducing CLCA1 activity in a cell, hence, are useful for treatment of a patient having a condition associated with the level of CLCA1, where the invention further comprises

regulate expression of chloride channel calcium activated 1 (CLCA1) genes by cleaving RNA derived from the genes. The nucleic acid sequences are useful as pharmaceutical agents for treating conditions such as chronic obstructive pulmonary disease (COPD), chronic bronchitis, asthma, cystic fibrosis, obstructive bowel syndrome and any other diseases or conditions tistue. The sequences are useful for reducing CLCA1 activity in a cell or tistue. The sequences are useful for reducing CLCA1 activity in a cell or associated with the level of CLCA1, where the invention further comprises the use of one or more therapies under conditions suitable for the treatment, for example, oxygen therapy, bronchodilators, corticosteroids, antibacterials, vaccinations, acetylcysteine and mucokinetic agents. The

The invention relates to enzymatic nucleic acid molecules that down

the use of one or more therapies under conditions suitable for the treatment, for example, oxygen therapy, bronchodilators, corticosteroids, antibacterials, vaccinations, acetyloysteine and mucokinetic agents. The nucleic acids of the invention are also used as diagnostic tools to examine genetic drift and mutations within diseased cells or to detect the presence of CLCA1 RNA in a cell. This sequence represents an enzymatic nucleic acid molecule of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                antiinflammatory; chronic obstructive pulmonary disease; COPD; asthma; chronic bronchitis; cystic fibrosis; obstructive bowel syndrome; oxygen therapy; bronchodilator; corticosteroid; vaccination; mucokinetic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Enzymatic polynucleotide that down regulates expression of chloride channel calcium activated gene, useful for treating Chronic obstructive pulmonary disease (COPD), chronic bronchitis and asthma -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering
nucleic acids of the invention are also used as diagnostic tools to examine genetic drift and mutations within diseased cells or to detect the presence of CLCA1 RNA in a cell. This sequence represents an enzymatic nucleic acid molecule of the invention.
                                                                                                                                                                                                                                                          Human, genome-derived myosin-like protein 1; GDMLP-1; hGDMLP-1; heart; muscle; myosin; chromosome 22; gene therapy; vaccine; heart disease; skeletal muscle disorder; amplicon; screening; ss.

of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The polynucleotide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the interesting of the hGDMLP-1 sequence in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                           N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequence.

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of brotein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used as probes to detect, characterise hGDMLP-1 nucleic acids in samples, as amplification and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polygeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific concentration, as therapeutic supplement in patients having specific concentration, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The polynucleotide sequences encoding hGDMLP-1 may be used for therapy. The polynucleotide sequences encoding hGDMLP-1 may be used for therapy. The polynucleotide sequences encoding hGDMLP-1 may be used for chromosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human, genome-derived myosin-like protein 1; GDMLP-1; hGDMLP-1; heart; muscle; myosin; chromosome 22; gene therapy; vaccine; heart disease; skeletal muscle disorder; amplicon; screening; ss.

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of brotein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification expressing the proteins are passing the proteins. The hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the specific concentration and/or amount specifically of hGDMLP proteins, as specific concentration, as therapoutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement deficiency in hGDMLP-1 production, and in vaccines or for replacement concentration as associated with the expression of hGDMLP-1, in no particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the increasing of the hGDMLP-1 sequence in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

```
The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 mucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins as proteins and proteins and proteins and proteins and proteins or an estandards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser describion is the properties of the patients having specific in state of the patient in patients having specific in the patient in patients having specific and patients are proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         deficiency in hoDMLP-1 production, and in vaccines or for replacement therapy. The polynucleotide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             chromosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequence.

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 mucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific. biomolecule capture probes for surface-enhanced laser desorption ionication, as therapeutic supplement in patients having specific. Concentration hGDMLP-1 production, and in vaccines or for replacement therapy. The polynucleotide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and selected muscle disorders. hGDMLP-1 is localised to diromosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequence.

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise concentration and/or amount specifically of hGDMLP proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific blomclecule capture probes for surface-enhanced laser desorption in hGDMLP-1 production, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement

therapy. The polynucleotide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present
                                                                                    N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequence.

protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise Concentration and/or amount specifically of hGDMLP proteins, as specific concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption concentration, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The polynucleotide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in patients heart and skeletal muscle disorders. HGDMLP-1 is localised to chromosome 22. The present sequence in the exemplification of the present in the exemplification of the present

Novel polynucleotide which down regulates expression of Ets-related gene, useful for treating cancer, diabetic retinopathy, macular degeneration, arthritis, psoriasis, verruca vulgaris and Sturge Weber syndrome

McSwiggen JA, Mclaughlin F, Randi AM;

Claim 4; Page 107; 149pp; English.

The invention relates to a nucleic acid molecule (I) which down regulates expression of an Ets-related gene (ERG). (I) is useful for treating conditions selected from cancer, lymphoma, Ewing's sarcoma, melanoma, tumour angiogenesis, diabetic retinopathy, macular degeneration, tumour angiogenesis, diabetic retinopathy, macular degeneration, necvascular glaucoma, myopic degeneration, arthritis, psoriasis, verruca vulgaris, angiofibroma of tuberous sclerosis, port-whose stains, Sturge Weber syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-rendu CC syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for treating a patient having a condition associated with the level of ERG, by contacting cells of the patient with (I) under conditions suitable for the treatment. The method comprises the use of one or more therapies under conditions suitable for the treatment. Leukaemia or tumour anglogenesis is treated by administering (I) to the patient in conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or conjunction such as Mg2+. (I) is useful for reducing ERG activity in a cell, by contacting the cell with (I). (I) is useful for cleaving RNA of ERG gene, by contacting (I) with RNA, in the presence of a divalent conclusion such as Mg2+. (I) is useful for signosis of conditions and diseases related to the expression of ERG, and as diagnostic tool to examine genetic drift and mutations within diseased cells or to detect CC the presence of ERG RNA in a cell. (I) is useful for specifically ctargeting genes that share homology with ERG such or ERG fusion genes. ABKI7354-ABK22719 represent nucleic acids, including antisense and cargainal proprises of conditions of ERG and enzymatic nucleic acid molecules which regulate expression of ERG such related PCR primers of the invention.

Novel polynucleotide which down regulates expression of Ets-related gene, useful for treating cancer, diabetic retinopathy, macular degeneration, arthritis, psoriasis, verruca vulgaris and Sturge Weber syndrome

Claim 4; Page 126; 149pp; English.

The invention relates to a nucleic acid molecule (I) which down regulates expression of an Ets-related gene (ERG). (I) is useful for treating conditions selected from cancer, lymphoma, Ewing's sarcoma, melanoma, tumour angiogenesis, diabetic retinopathy, macular degeneration, the form cancer, lymphoma, Ewing's sarcoma, melanoma, tumour angiogenesis, diabetic retinopathy, macular degeneration, culturating, angiofibroma of tuberous sclerosis, port-wine stains, Sturge weber syndrome, Rippel-Trenaunay-Weber syndrome, Osler-Weber-rendu syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for treating a patient having a condition associated with the level of ERG, by contacting cells of the patient with (I) under conditions suitable for the treatment. The method comprises the use of one or more therapies or under conditions suitable for the treatment. Leukaemia or tumour angiogenesis is treated by administering (I) to the patient in conjunction with one or more of other therapies such as radiation or chemotherapy treatment. (I) is useful for reducing ERG activity in a cell, by contacting (I) with RNA, in the presence of a divalent cation such as Mg2+. (I) is useful for diagnosis of conditions and diseases related to the expression of ERG, and as diagnostic tool to examine genetic drift and mutations within diseased cells or to detect the presence of ERG RNA in a cell. (I) is useful for specifically cated molecules which regulate expression of ERG, and carginal matter and mutations and carginal matter of the invention.

```
The invention relates to a novel isolated 17 mer nucleic acid sequence, given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence, a sequence, a least 15 consecutive nucleotides from the 17 mer sequence, a sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding NNA. The novell isolated nucleic acids of the invention are useful as probes and primers for detecting, identifying, quantifying and/or amplifying a nucleic acid, and for production of recombinant polypeptides. Any of the nucleic acid, and for production of recombinant polypeptides. Any of the nucleic acids, polypeptides, vectors containing the nucleic acids, cells containing the polypeptides are useful for preparation of planmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell cageneration, specifically cancer but also Alzheimer's disease and schizophrenia. Analysis of the expression of the 17 mer nucleic acids in patient samples is useful for diagnosis and/or prognosis of these patient samples is useful for diagnosis and/or prognosis of these chizophrenia and antibodies are useful as components of protein chizory. The nucleic acid sentions the prolypeptide and antibodies are useful as components of protein chizory. The nucleic acid sequences of the inventor acids and better the prolypeptide and antibodies are useful as components of protein chizory.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              therapy. This polynucleotide sequence represents a tumour suppression related human fukutin oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated nucleic acid, useful for treating viral diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 17 BP; 2 A; 10 C; 1 G; 4 T; 0 other;

Theriton relates to a movel 1801 and 1801 at least 15

onsecutive nucleotides from the 17 mer sequence, a sequence, optimal alignment, at least 80 % identity to the 17 mer sequence, a sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, identifying, quantifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti) sense reagents, and for production of recombinant polypeptides. Any of the nucleic acid, polypeptides, vectors containing the nucleic acids, collscanding the nucleic acids, collscanding the nucleic acids, collscanding the vector or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell diseases that are characterised by development of tumours or cell diseases that are characterised by development of tumours or cell diseases. The polypeptides can also be used to generate antibodies, and both the polypeptide and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene therapy. This polymucleotide sequence represents a tumour suppression related human fukutin oligonucleotide of the invention.

The invention relates to a novel isolated 17 mer nucleic acid sequence,

Disclosure; Page 191; 720pp; French.

New isolated nucleic acid, useful for treating viral disear associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells

```

```
The invention describes an enzymatic nucleic acid molecule (I) which down regulates expression of a sequence encoding a subunit of nuclear factor regulates expression of a sequence encoding a subunit of nuclear factor cander and is useful for an inozyme, ginzyme, G-cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A.

(I) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially MG-2+. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung, correctal, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug therefore as monoclonal antibodies, REL-A-specific inhibitors or chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate, colophosphamide, doxorubin, fluoruracil carboplatin, edairexate, cyclophosphamide, doxorubin, fluoruracil carboplatin, edairexate, colomical are are also useful for treating inflammatory disease such as frequenced are also useful for treating inflammatory disease such as the contral nervous system (CSS) and mycoardal, cochical, respection, gene therapy applications, ischaemia/reperitusion injury central nervous system (CSS) and mycoardal, genecitaloner represents the substrate of a novel

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ô
                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecules are useful for arti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ55889 - ABZ65216, ABZ6444 - ABZ65531, ABZ6520 - ABZ65216, ABZ65530 - ABZ65531, sequences for the human ribozymes of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        lymphocytes, treatment of endogenous hyperexpression of TGF-beta, treatment of breast tumours, neurofibromas and malignant gliomas, including glioblastomas, treatment and prophylaxis of skin carcinogenesis, and treatment of oesophageal and gastric carcinomas. See AAQ78352-Q78488 The sequences given in GENESEQ files AAQ78352-Q78407 and AAQ78488 are antisense oligodeoxynucleotides of
EcoRI site of Lambda-ZAP.Phage were packaged and plated. Plaque screening was with a 991bp XbaI fragment from the mouse enhancer region, a 1.5kb CDNA fragment from the heavy chain constant region gene of hybridoma CEA.66-E3 and a 5.4kb EcoRI fragment containing an aberrantly rearranged heavy chain Sp2/O. Positive clones were further characterised by hybridisation to J-region oligonuclecties and a probe specific to the N-terminal region. This probe was used to allow upstream characterisation of

The ENA's can inhibit collagenase and stromelysin production in the synovial membrane of joints for the treatment or prevention of arthritis, particularly osteoarthritis or rheumatoid arthritis. The ENA's can also

ö
        in a recipient to an alloaningen of a donor. They can also be used for treating graft tolerance or for treating autoimmune disease, and for treating alleagues and other inflammatory conditions. The ENA's can also be used in diagnosis. Ribozyme therapy impacts on the expression of stromelysin without introducing the non-specific effects upon gene expression which accompany treatment with retinoids and dexamethasone. The concentration of ribozyme required to affect a therapeutic treatment is lower than that required of antisense molecules, and is highly specific. The present sequence is used in the exemplification of the
be used to treat antigen presenting cells of a donor to induce tolerance
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       granule bound starch synthase; hammerhead ribozyme; hairpin ribozyme; modulation; gene expression; transgenic plant; cleavage; canola plant; caffeine synthesis; coffee plant; nicotine production; tobacco; fruit ripening; flower pigmentation; lignin production; ss.

A naturally occurring polymorphism has been identified at position 117 of hIL-9, individuals homozygous for Met at position 117 of hIL-9, lack of asthma and low serum immunoglobulin E (1gB) levels, while Thr/Thr homozygotes and Thr/Met heterozygotes are susceptible to

The present invention describes an enzymatic nucleic acid molecule (I) with RNA cleaving activity, which modulates the expression of a plant gene. Also described is a gene comprising a cDNA sequence encoding maize Delta-9 desaturase. (I) can be used to modulate expression of a gene, preferably Delta-9 desaturase or a granule bound starch synthase (GBSS) gene, in a plant (preferably a maize or canola plant). (I) can be used to modulate caffeine synthesis in a coffee plant, nicotine production in a tobacco plant, fruit ripening processes in an apple, tomato, pear, chrysanthemum or marigold plant or lignin production in a tobacco,

Ribozyme which modulates plant gene expression - preferably modulates expression of DELTA-9 desaturase or granule bound starch synthase in maize or canola

A method has been developed for determining a genotype associated with increased susceptibility to manic-depressive (MD) illness. The method comprises determining the genotype of an affected individual with at least one polymorphic marker localised within the chromosomal region defined by and including markers D182843 and D188869 and determining the genotype associated with increased susceptibility to MD disorder. The method can be used for determining susceptibility to MD disorder. The including bipolar disorder, genetic counselling of individuals from families affected with MD illness, and aid in the differential diagnosis of MD illness from other psychiatric pathologies. Products from the present invention can also be used to obtain modulators of IMP.180 myoland therapeutic treatments. The present sequence represents a PCR primer used in the mapping of human chromosome 18 for determining the genotype continuation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated IMP.18p myo-inositol monophosphatase - used to develop products for determining susceptibility to manic depressive illness and as targets for preventive and therapeutic treatments
                                                                                                                                                                               Manic-depressive illness; susceptibility; genotype; diagnosis; chromosomal marker; polymorphic marker; chromosome 18; human; myo-inositol monophosphatase protein; IMP-18p; PCR primer; ss.

Sequences shown in AAV41331 to AAV41340 represent exon specific primers of human interleukin (IL-9) gene. The invention provides a method for the treatment of inflammatory bowel disease (IBD) or related disorders that comprises administering a compound that up-regulates the function of IL-9 or the IL-9 receptor. A method for monitoring humans undergoing IBD treatment with polypeptides with human IL-9 sequence of fragments), by evaluating IL-9 levels in samples taken at different times, and a method for screening for cells expressing the IL-9 receptor. By detecting binding of a specific ligand are also provided. Compounds therapeutically (in pharmaceutical compositions, optionally with acceptable carriers) to treat IBD and other related inflammatory disorders. IBDs (which include Crohn's diseases and chronic non-specific contentive collitis) are diseases characterised by an inappropriate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                .

Immune responses to antigens are classified as Thi or Th2 responses, and evidence suggests that IBDs are dominated by a Thi mediated, antigen induced, inflammatory response. Other related Thi mediated diseases include multiple sclerosis, diabetes, arthritis, lupus and autoimmune diseases. The method is based on the observation that the Th2 response is up-regulated by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                     Treating inflammatory bowel diseases, e.g. Crohn's disease - and chronic non-specific ulcerative colitis by administering compounds up-regulating function of interleukin-9 or its receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ٠,

invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers of thee invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaccutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaccutical agents acting on a disease as well as other transmitted.
                                                                                                                                                                                                                                                                                                                                                                                                               Novel biallelic markers used to construct a high density disequilibrium
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   to AAZ69578 represent human biallelic markers from the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The human gene has been mapped to chromosome 3p21.1. This gene and the alpha-2-delta-D and -B genes are useful for protecting mammalian cells from abnormal calcium flux by introducing expression vectors containing useful for treating or preventing expression vectors containing useful for treating or preventing epilepsy. The antisense genes are also useful for treating or preventing epilepsy. The alpha-delta-2-A protein is a high-affinity binding target of the anti-convulsant drug gabapentin. Therefore, alpha-delta-2 proteins may also be targeted to treat esizate syndromes, migraine, ataxia, vestibular defects, chronic pain, sleep interference, anxiety, amyotropic lateral sclerosis (ALS), antitiple sclerosis, mania, tremot, parkinsonism, substance abuse or addiction syndromes, mood, depression or cancer.
                                                                                                                                                                                                                                                       New human nucleic acids encoding the alpha2delta-C and alpha2delta-D proteins, useful in the treatment of epilepsy, migraine, chronic pain, anxiety, multiple sclerosis or cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             curling virus; CmYLCV; transcription; PCR primer;

The invention relates to Cestrum yellow leaf curling virus (CMYLCV) novel DNA sequences which functions as transcription promoters of an associated polynucleotide sequence. These CMYLCV DNA molecules confers constitutive expression of associated polynucleotide sequences. The invention also relates to recombinate DNA sequences containing promoter sequences which are used for creating transgenic plants expressing DNA of interest at all times and in most tissues and organs. The present DNA sequence is a PCR prime; which is used for amplifying Cestrum yellow leaf curling virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel polypeptide vaccine produced in plants, useful for inducing an immune response to a self-antigen on the surface of certain tumour cells
                                                                       DNA sequence obtained from genome of Cestrum yellow leaf curling for conferring constitutive expression of an associated desired

or over expressed by, cells of the tumour, thereby distinguishing the tumour from all other tumours of the same or different histological type, or in the subject or in another member of the subject's species. (1) is epitopes in their native form. (1) is capable of inducing an immune response in a mammal, when used as an individual-specific immunogenic product comprising (1); and as a vaccine composition useful for inducing a tumour-specific immune response to at least one idiotype of a surface immunoglobulin or a polyclonal immune response to at least one idiotype. The vaccine composition is useful for inducing a tumour-specific immune antibody response in a tumour-bearing subject or a subject who had a nutbody response in a tumour-bearing subject or a subject who had a composition is useful for inducing a tumour is clinically or radiographically evident. (1) is useful for inducing a protective antitumour immune response. (1) can be produced at high conformation of the native epitopes displayed at the tumour cell surface. AAS45529-AAS45579 represent B cell lymphoma self antigen vaccine ò The present invention provides the protein and coding sequences of leptin fragments which modulate the activity of lipolysis stimulated factor LLSR). These sequences are useful in the treatment of obesity related diseases, including obesity, anorexia, cachexia, cardiac and coronary insufficiency, stroke, hypertension, atheromatous disease, atheroselerosis, non-insulin dependent diabetes, hyperlipidaemia, New leptin polypeptide fragment and related polynucleotides, useful for the prevention and treatment of obesity and obesity-related diseases Gaps ; 0 Leptin; human; LSR; lipolysis stimulated receptor; obesity; hypertension; anorexia; cachexia; stroke; atherosclerosis; ds. 1.0%; Score 13.8; DB 1; Length 18; 88.2%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to a method for treating a patient diagnosed as having a lower than normal high density lipoprorein-cholesterol (HDL-C) level, a higher than normal triglyceride level, or a cardiovascular disease, involving administering a compound that modulates LXR- or RXR-mediated transcriptional activity or ABC1 expression or activity. The LXR gene product may be used in an assay to identify compounds useful for the treatment of a disease or condition self lower than normal HDL cholesterol level, a higher than normal triglyceride level, and a cardiovascular disease.

```
The invention provides antisense compounds capable of inhibiting the expression of human Her-3, a member of epidermal growth factor (EGF) family of receptor/tyrosine kinases. The antisense oligomucleotides are useful for inhibiting the expression of Her-3 in cells or tissues. They are commonly used as research reagents and in diagnostics for example, to elucidate the function of particular genes. The antisense compounds are also useful for distinguishing between functions of various members of a biological pathway and for research use. They are also utilized for dispnostics, therapeutics, prophylaxis and in kits. They are useful prophylactically, e.g. to prevent or delay infection, inflammation or tumor formation. Sequences AAHA752-47615 represent chimeric antisense phosphorothioate oligonucleotides having 2'-MOE wings and a deoxy gap, used for the inhibition of Her-3 mRNA expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            .
